## New Android unified messaging application for Popfax customers

**Popfax.com**, the leading European provider of [Internet fax](#) services has developed a new Android application called **Popcompanion mobile** that turns a mobile device into a pocket fax machine. All Popfax features and faxing options are integrated into the new mobile application. POPFAX is offering its customers instant access, wherever they are and whenever they need it, to faxes, SMSs, and voice messages, directly from their smart phones.

The application is available for free, and can be downloaded from the [Popfax website](#) or from the [Android marketplace](#).

*"As business becomes more pervasive, always carrying a unified messaging solution with you makes more sense: you may never know when you need it, but when you do it is there, in the mobile device that stays with you 24/7. The application was first released on the Android platform, which seems to have the fastest pick-up with our clients. Releases for other platforms like Blackberry and iPhone will be available very soon."* Vladimir Popesco, managing director of Popfax.com.

The new application works in conjunction with a Popfax online account and allows customers to:

- Send and receive faxes or SMSs
- View, download and forward faxes to email, or to another fax number
- Receive and listen to voice messages
- Personalize faxes with a cover page
- Manage personal contacts and folders

With **Popcompanion mobile** your business communications now fit in your pocket. Download, scan or take a picture of a document and fax it instantly using the installed Popcompanion.
